JIDO TAGS PROJECT SUMMARY

This project is a wristwatch in which we name JIDO. So as an individual using the watch it is called your TAG so that is how JIDO-TAGS came about. Below is a summary of what the watch does:

- It displays date and time like a normal wristwatch.
- It takes location readings of the individual and sends these readings to our database.
- It contacts people and security bodies when the individual is in danger and updates our database on individual's location.
- It consists of a Taser for self-defense when individual is in danger.

What we intend to do:

- With the reading logged in our database we can create a safety map so as to help the security agencies know where danger occurs most (Robbery, kidnapping).
- With the data collected we intend to know where citizens pass most and help security agencies to know how to protect citizens.
- When a citizen is in trouble. Their TAGS gives a call to the nearest police station and to the citizen's next of kin.
- Other relatives registered to receive alert will also be contacted.
- We also intend to make citizen know how safe their location is so as to take necessary cautions.
- If an alert is sent and user is moved. The users new location will always be updated and can be tracked using google map
- The users location will be continuously broadcasted until the user hits safe button
- We intend to link user location with Google map
